

Multi-Voice Testing Guide

Current Status

✅ Working on test video (October in Slow German):

- **Nova:** Female narrator (woman in yellow) — speaker_0
- **Onyx:** Male speaker (Janus) — speaker_1
- **Shimmer:** Woman in blue — speaker_2 (needs verification, may have fewer lines)

How to Test on New Videos

1. Choose Test Videos

Good test candidates:

- 2-3 distinct speakers
- Different genders (easier to verify)
- Clear speech (not overlapping)
- Moderate length (5-15 minutes)

2. Testing Process

1. Load video in Tutorial Clarity
2. Click “🎯 **Detect Speakers with AI**”
3. Wait for detection to complete (~1-3 minutes)
4. Check console for speaker distribution:

```
speaker_0: X segments
speaker_1: Y segments
speaker_2: Z segments
```
5. Verify voice assignments in UI (Female/Male selections)
6. Click “**Apply & Regenerate Audio**”
7. Click “🔊 **Test Audio Blobs (Play First 5)**”
8. Listen and verify voices match speakers

3. What to Check

✅ Good signs:

- Multiple speakers detected (not all speaker_0)
- Different voices for different speakers
- Voices stay consistent (no mid-sentence changes)
- Audio synced with video

❌ Warning signs:

- All segments labeled speaker_0
- All audio using same voice
- Voices changing mid-sentence
- Audio playing too early/late

4. Document Results

For each test video, note:

- Video URL
- Number of speakers detected
- Which voices were correct
- Any issues observed

5. Known Limitations

- Works best with 2-3 speakers
- Requires clear, distinct voices
- May struggle with:
 - Heavy background noise
 - Overlapping speech
 - Very similar voices (two women, same age/accent)
- More than 3 speakers

Troubleshooting

If all speakers show as speaker_0:

1. Try “🔧 Manual Detection (Gap-Based)” instead
2. Check if video has captions available

If voices sound wrong:

1. Check console for “Expected Voice” vs “Cached Voice”
2. Try regenerating with different gender assignments
3. Use “Nuclear Clear & Regenerate” to start fresh

If detection fails:

1. Check console for errors
2. Video may not have downloadable audio
3. Try a different video

Success Criteria

The system is working well if:

- ☒ Detects correct number of speakers (2-3)
- ☒ Assigns distinct voices to each
- ☒ Voices stay consistent throughout
- ☒ Audio synced with video timing
- ☒ Works on 80%+ of test videos

Next Steps

After testing 5-10 videos:

1. Report which types work best
2. Note common failure patterns
3. Decide if ready for production use
